Design Specification

Contacts Page(v 0.2)

Introduction

Basically, contacts work very much like the way Skype operates.

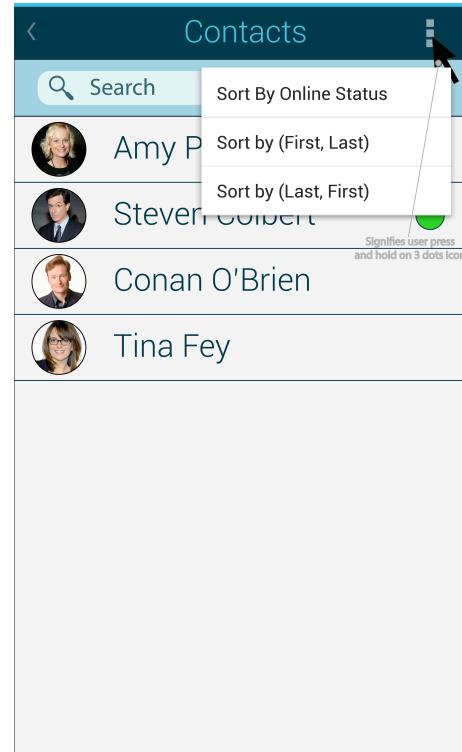

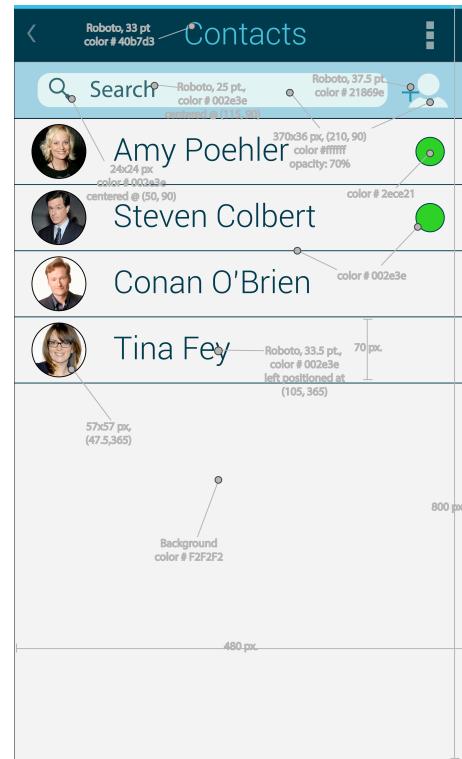

OpenComm

How it Works

After user taps on contacts icon in dashboard, they'll be directed to the contacts list, as shown to the right. The list will be first sorted by who is available (denoted by a green dot). The next sort priority will be by first name, and a dropdown menu will give the user to sort by last name as well.

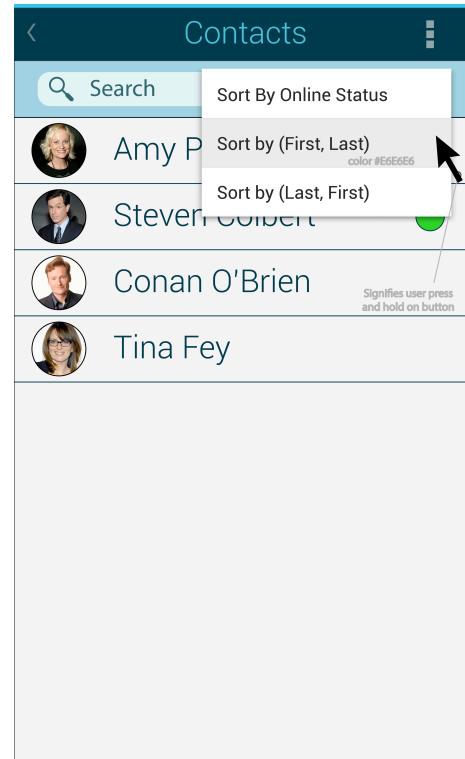

Tapping on a name will take the user to a more detailed contact information page, as shown on the next page

On the detailed contact information page, the contact's publicly available information will be displayed. The user cannot edit any of this info, but can invite the person to a conference.

Adding A Contact

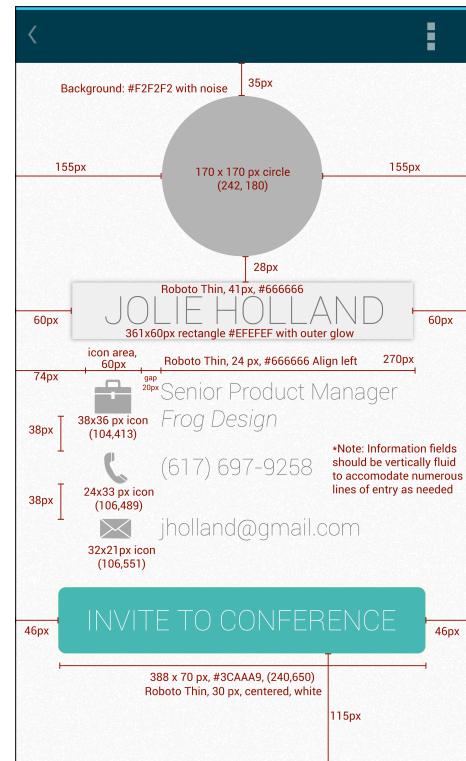

To add a contact, the user can simple tap on the "Add Contact" icon. Once tapped, the user's contacts will fade away leaving just the search bar at the top. The "search" text will be replaced with "Lookup Users" and can search the database of users. The matching results will appear exactly like the list for his/her own contacts. They can also tap on the user's name to see more detailed information and request to connect with them.

OpenComm

Detailed Contact Info

On this page, the user can see more information about the contact he/she has chosen.

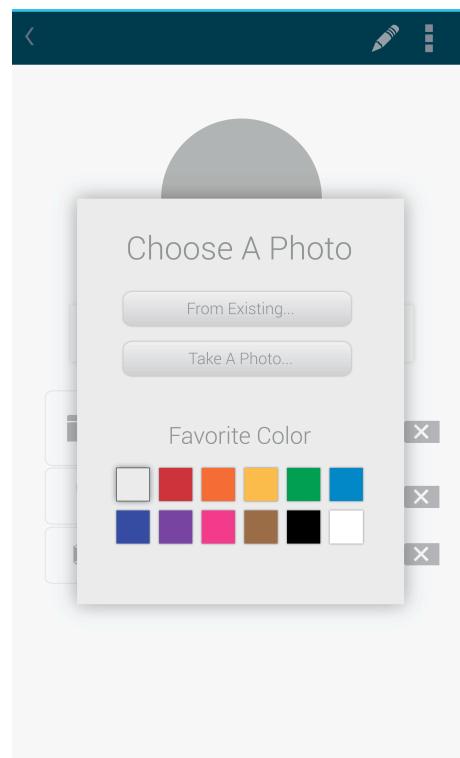

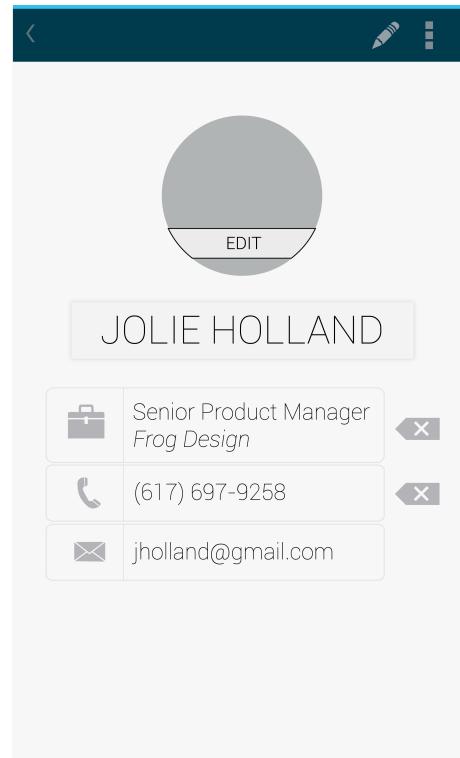

OpenComm

Editing Personal Information

From the Dashboard, there will be a "Personalization" option that will bring the user to a page where the user can edit information that can be publicly seen.

To edit settings, the user taps the edit icon in the Action Bar in the upper right-hand corner. When this happens, an animation will take place where an edit label appears over the person's photo, and the individual's attributes will shift to the left to allow delete buttons to appear. Also note that the text changes color from gray to black, and a line appears between the icon and the text.

When a user wants to select or edit a photo, a popup will appear over the page, where the user can select to either choose an existing photo or take a photo. The user can also choose a favorite color, which will be the color of the label that other users see when in a conference. Also note that the selected color has a small outline surrounded by a larger drop shadow than the others.
